1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on January 15, 2004 has been entered.

***Reasons for Allowance***

2. The following is an examiner's statement of reasons for allowance:

Re-claim 1 Kajino et al. (5,857,380) discloses, as shown in fig. 10, an engine starting apparatus comprising: a driven gear 14; a starter motor 2; a speed-reduction and power-cut-off mechanism connected to said starter motor and having a rotatable output shaft 4, said speed-reduction and power-cut-off mechanism being adapted to output a rotation of said starter motor from said output shaft while reducing the rotational speed of the starter motor and to cut off power transmission between starter motor and said output shaft when rotational speed of said output shaft exceeds the reduced rotational speed of the starter motor; a drive gear 65 provided on the output shaft to move axially over said output shaft between engagement and disengagement position with said driven gear; and a driving unit 3 driving said drive gear to said engagement position when engine is started and to said disengagement position after

Art Unit: 3683

engine has been started. However Kajino et al. failed to disclose wherein the drive gear moves axially, independently of the speed-reduction and power-cut-off mechanism.

Re-claim 5 Kajino et al. discloses, as shown in 10, an engine starting apparatus comprising: a driven gear 14; a starter motor 2; a speed-reduction and power-cut-off mechanism, a drive gear 65 provided on the output shaft to move axially over said output shaft between engagement and disengagement position with said driven gear; and a driving unit 3 driving said drive gear to said engagement position when engine is started and to said disengagement position after engine has been started. However Kajino et al. fails to disclose a wedge roller type speed-reduction and power cut-off mechanism and wherein the drive gear moves axially, independently of the speed-reduction and power-cut-off mechanism.

The aforementioned limitations and the arrangements thereof are not taught in the prior art. In light of the foregoing, the claims of present application are found to be patentable over the prior art of record.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

3. Claims 3-6 are allowed.
